

## ABSTRACT OF THE DISCLOSURE

A container transport system for transport of an article, in particular a baggage item, includes a container for receiving an article, with the container made of flame-resistant, wear-resistant and translucent plastic material which is stable in shape. The container has an underside which is formed with touch surfaces extending in a transport direction by which the container is advanced by a conveyor between a receiving end and a discharge end. The conveyor is provided with a guiding and/or driving engagement assembly for cooperation with the touch surfaces of the container.
